Design Rules

Design rules give minimum feature sizes and spacings

Designers generally do layouts to minimize size of circuit subject to design rule constraints (because yield, cost, and performance usually improve)

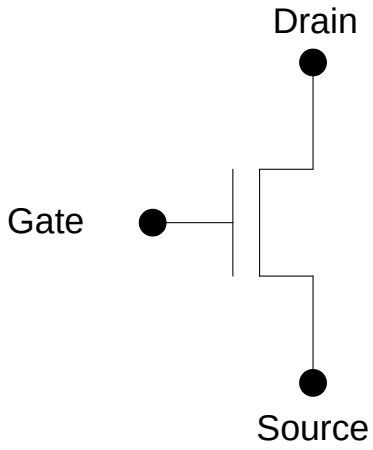
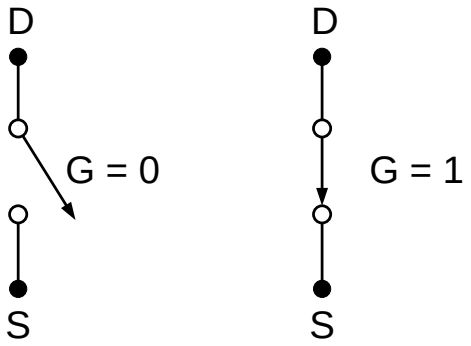
n-channel MOSFET



Equivalent Circuit for n-channel MOSFET



- Source assumed connected to (or close to) ground
- V_{GS}=0 denoted as Boolean gate voltage G=0
- V_{GS}=V_{DD} denoted as Boolean gate voltage G=1
- Boolean G is relative to ground potential

Design Rules (example)

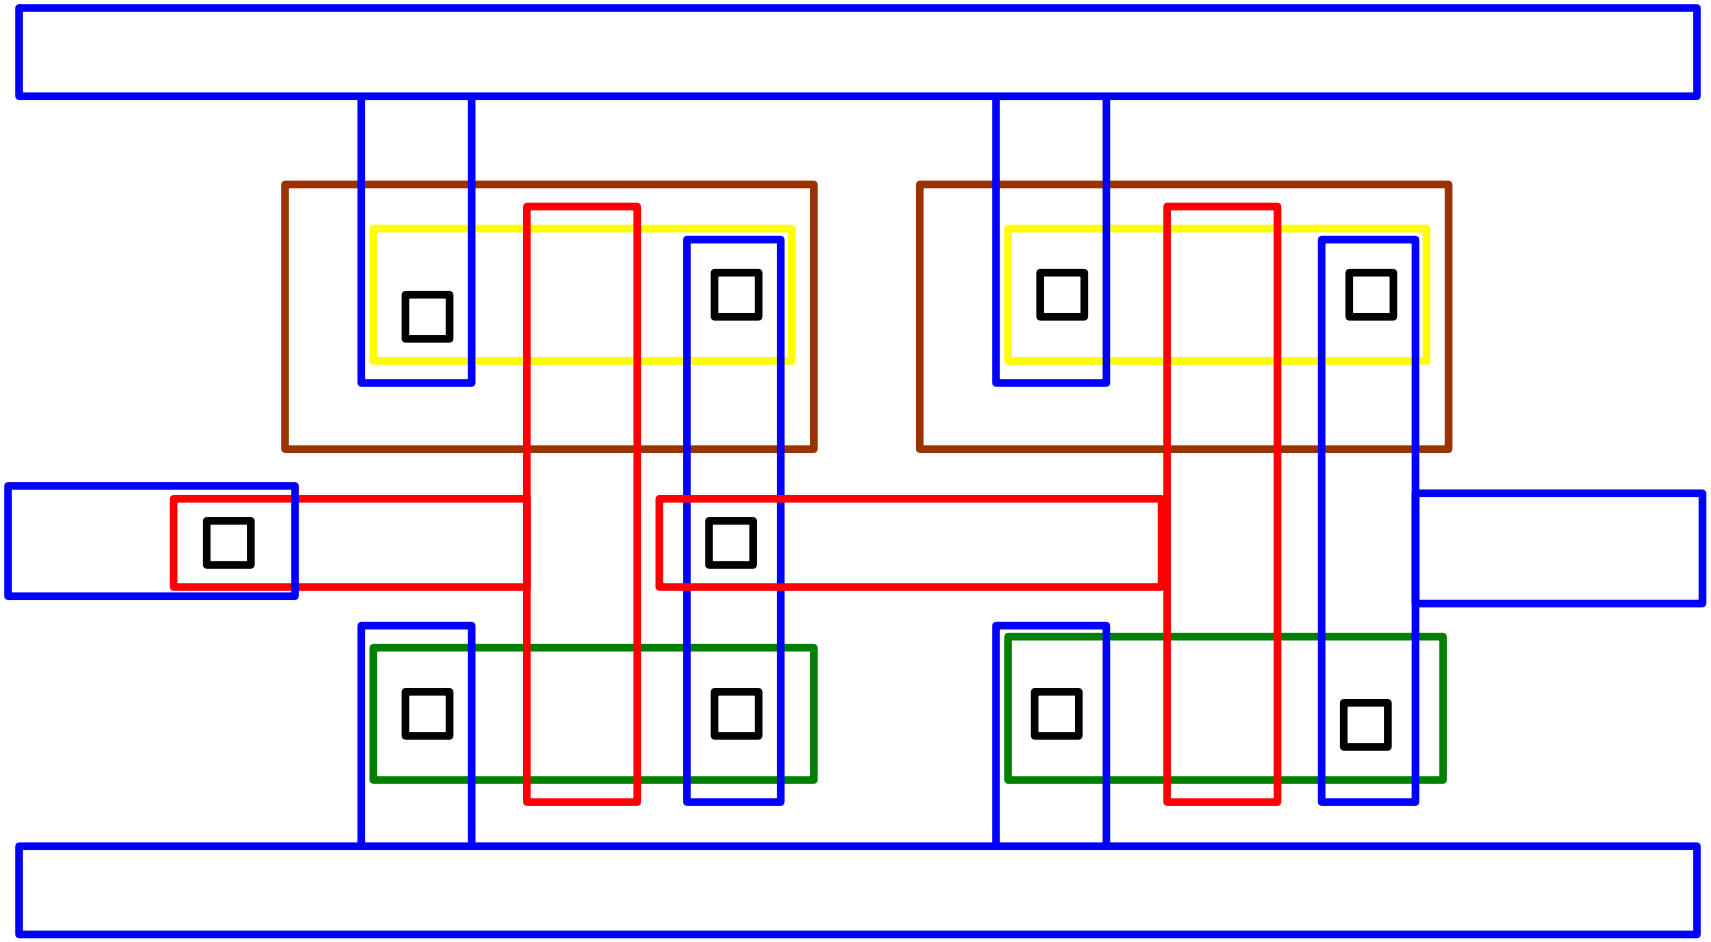
- Polygons merged in Geometric Description File (GDF)
- Separate rectangles generally more convenient to represent

Design Rules (example)



- Design rules must be satisfied throughout the design
- DRC runs incrementally during layout in most existing tools to flag most problems
- DRC can catch layout design rule errors but not circuit connection errors

Design Rules (example)

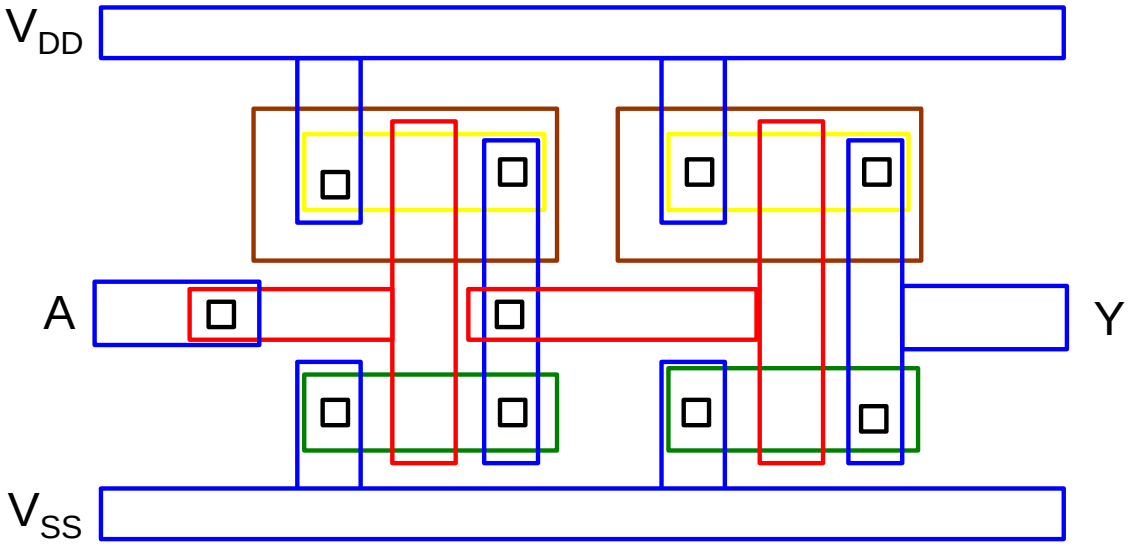
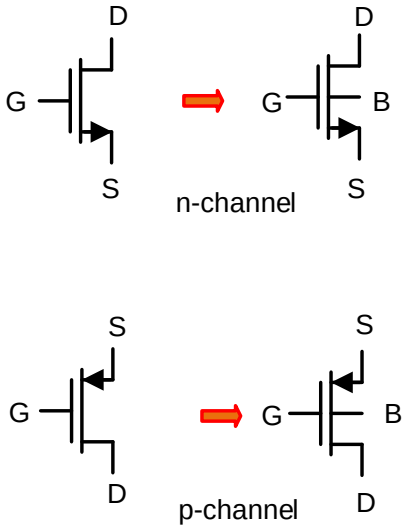
Bulk connections missing!

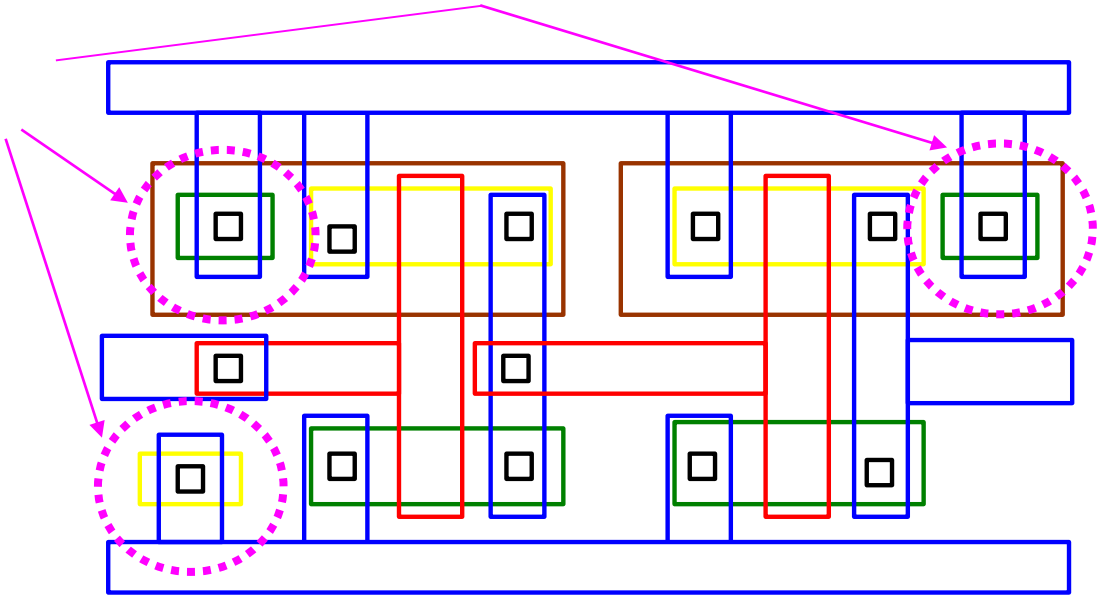
Design Rules (example)



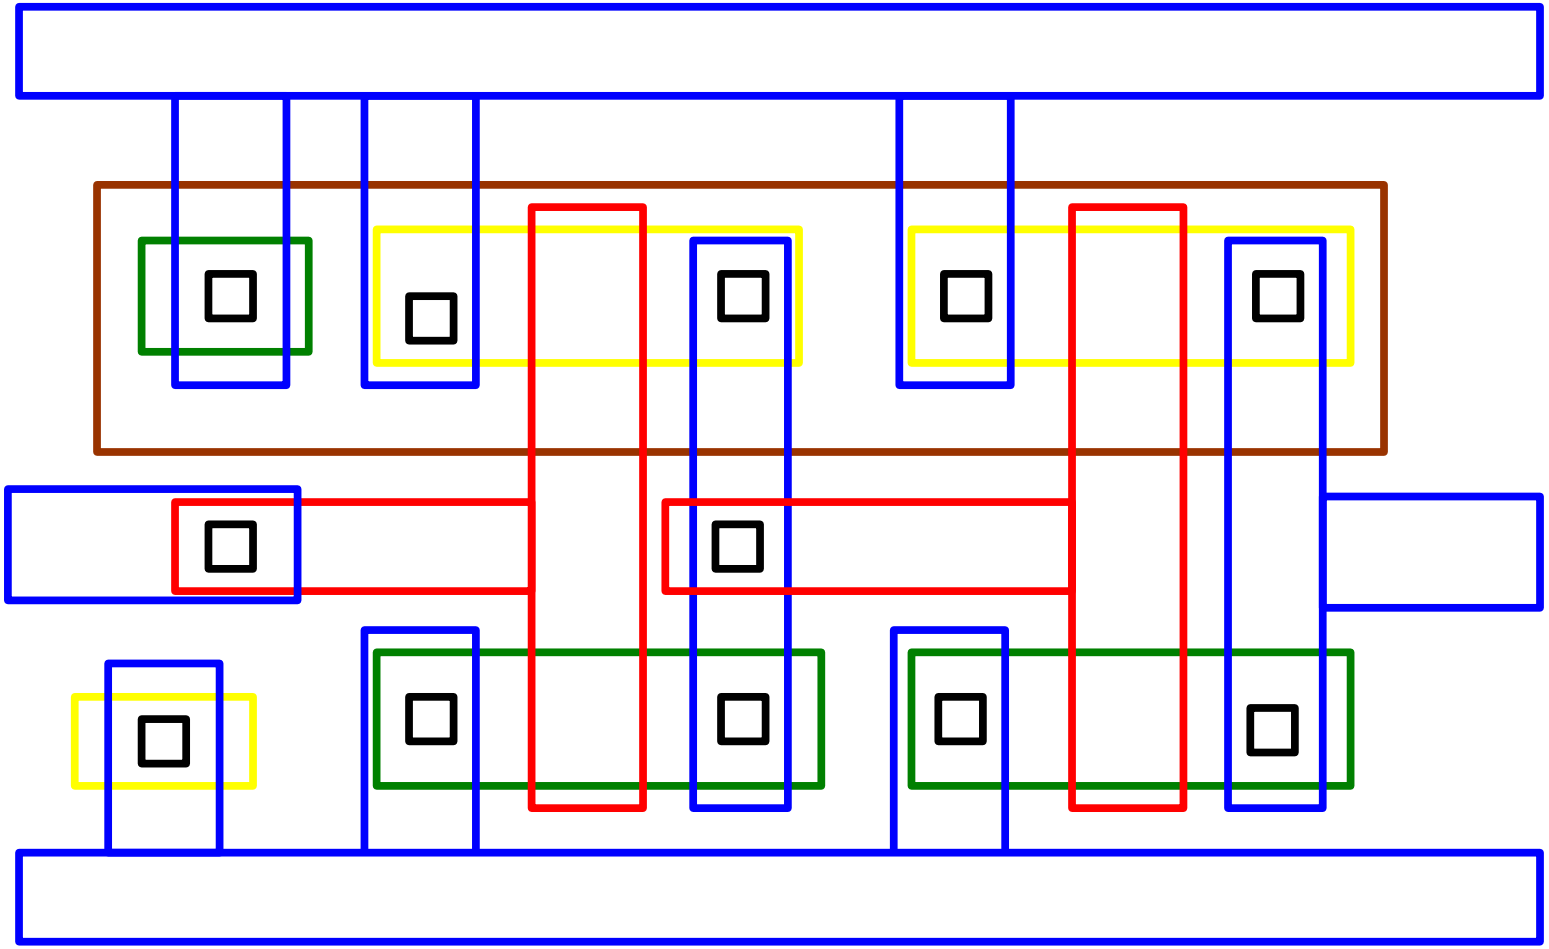


Actually 4-terminal device

- Note diffusions needed for bulk connections
- Note n-well connections increase area a significant amount
- Note n-wells are both connected to V_{DD} in this circuit

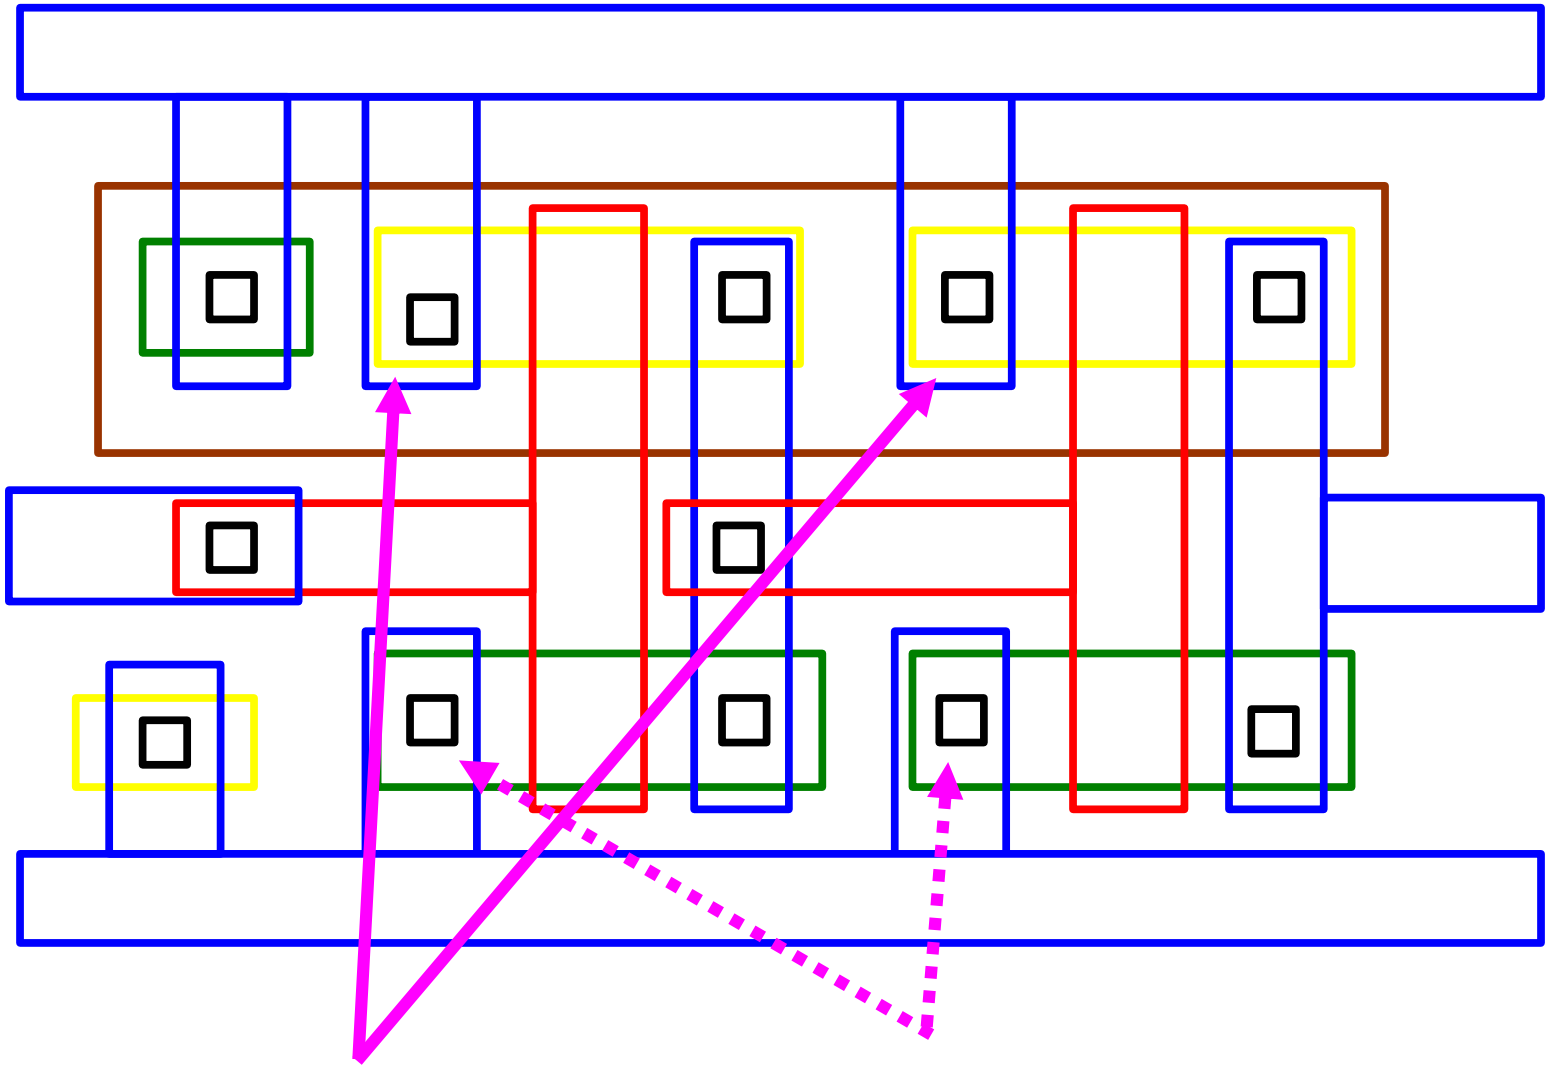


Design Rules (example)



Layout with shared p-well reduces area

Design Rules (example)



Shared p-active can be combined to reduce area

Shared n-active can be combined to reduce area

Design Rules

- Design rules can be given in absolute dimensions for every rule

- Design rules can be parameterized and given relative to a parameter
  - Makes movement from one process to another more convenient
  - Easier for designer to remember
  - Some penalty in area efficiency
  - Often termed λ-based design rules
  - Typically λ is ½ the minimum feature size in a process

Process Family Description

This non-silicided CMOS process has 3 metal layers and 2 poly layers, and a high resistance layer. Stacked contacts are supported. The process is for 5 volt applications. MOSIS orders EPI wafers for this process. Non-EPI (bulk) is an additional cost option and not available for MEP submissions. PiP (poly2 over poly) capacitors (950 aF/μm²) and the HRP (High Resistance) option are available on multiproject runs.

B5F Process

The B5F process offers the above layers of C5N plus Thick_Gate, N_Minus_Implant (Npblk), and P_Minus_Implant (Ppblk).

Our labs and class projects

2.1. Well Type

The Scalable CMOS (SC) rules support both *n*-well and *p*-well processes. MOSIS recognizes three base technology codes that let the designer specify the well type of the process selected. SCN specifies an *n*-well process, SCP specifies a *p*-well process, and SCE indicates that the designer is willing to utilize a process of either *n*-well or *p*-well.

An SCE design must provide both a drawn *n*-well and a drawn *p*-well; MOSIS will use the well that corresponds to the selected process and ignore the other well. As a convenience, SCN and SCP designs may also include the other well (*p*-well in an SCN design or *n*-well in an SCP design), but it will always be ignored.

MOSIS currently offers only *n*-well processes or foundry-designated twin-well processes that from the design and process flow standpoints are equivalent to *n*-well processes. These twin-well processes may have options (deep *n*-well) that provide independently isolated *p*-wells. For all of these processes at this time use the technology code SCN. SCP is currently not supported, and SCE is treated exactly as SCN.

2.2. SCMOS Options

SCMOS options are used to designate projects that use additional layers beyond the standard single-poly, double metal CMOS. Each option is called out with a designator that is appended to the basic technology-code. Please note that not all possible combinations are available. The current list is shown in Table 1.

MOSIS has not issued SCMOS design rules for some vendor-supported options. For example, any designer using the SCMOS rules who wants the TSMC Thick_Top_Metal must draw the top metal to comply with the TSMC rules for that layer. Questions about other non-SCMOS layers should be directed to support@mosis.com.
