

# Lecture 1. Overview

August 27, 2018

# Syllabus

Please check Syllabus on Canvas for more detailed information

# Discuss With Your Neighbors

What do you know about programming languages?

Why do we learn programming languages?

What do you want to learn about programming languages?

# Practical Values of COM S 342

- ▶ ability to quickly learn a new language
  - ▶ Apple: Swift
  - ▶ Google: Go and Dart
  - ▶ Microsoft: F# and TypeScript
- ▶ work as a language/compiler person: design and implementation of domain-specific language (DSL)
- ▶ better programmer: select an appropriate language for the task
- ▶ foundation of computer science, problem solving skills and mindset: help write efficient code, design data types, application programming interface (API)

# Content Keywords

Functional programming: Racket <sup>1</sup>

Logic programming: SWI-prolog <sup>2</sup>

Language features and interpreter implementation

Theoretical foundations: Grammar, Formal semantics, Lambda calculus

---

<sup>1</sup><https://racket-lang.org/>

<sup>2</sup><http://www.swi-prolog.org/>

Let's beginning ...

# Language: a Tool for communication

- ▶ Syntax for validity
- ▶ Semantics for understanding

# Programming Languages

languages that express computations

# History of Programming Languages (further reading <sup>3)</sup>)

1950s: FORTRAN, LISP, COBOL (NASA, ATMs, credit card)

1970s: PASCAL, C (Unix)

1980s: C++ (Firefox, Chrome, Adobe, IE)

1990s: Python, Java (Android)

2018 top programming languages

Language Rank	Types	Spectrum Ranking
1. Python	  	100.0
2. C++	  	98.4
3. C	  	98.2
4. Java	  	97.5
5. C#	  	89.8
6. PHP		85.4
7. R		83.3
8. JavaScript	 	82.8
9. Go	 	76.7
10. Assembly		74.5

# Types of a Programming Languages

- ▶ **general-purpose language**: express all computation
- ▶ **domain-specific language**: support data types, relations, operations in domain
  - ▶ the Dot language for Graphviz – purpose: graph visualization, special concepts: nodes/edges
  - ▶ the HTML language for browsers – purpose: display web pages, special concepts: markup or typesetting related concepts
  - ▶ the SQL language for database – purpose: query database, special concepts: support query, join database
- ▶ **assembly language**
- ▶ **high level language**: programs in high-level languages are eventually translated to machine level via *Compilation*, *Interpretation* or *Hybrid*

# Parts of a Programming Language

- ▶ **Computation**: to actually compute, e.g. primitive expressions, addition, subtraction, multiplication
- ▶ **Composition**: to put together computation, e.g., sequential (order), choice, or repeat
- ▶ **Abstraction**: to make programming scalable, e.g., function, name, that can be repeatedly used to refer to a complex piece of computation

# How to Specify a Language

1. English prose and examples in a careful, expository document (ambiguous, corner cases)
2. compiler <sup>4</sup>, interpreter <sup>5</sup> implementation
3. Formal, mathematical tools: grammar, semantics

---

<sup>4</sup>Interpreter: Translates program one statement at a time.

<sup>5</sup>Compiler: Scans the entire program and translates it as a whole into machine code.

# Programming Paradigms, Programming Styles

Ways of thinking about computation:

- ▶ Imperative: Fortran, Pascal, C
- ▶ Object-oriented: Smalltalk, C++, Java
- ▶ Functional: ML, Ocaml, Haskell, Scheme, Scala
- ▶ Logic: Prolog

functional programming (FP) is a programming style in which mathematical (partial) functions are used as the core programming abstraction. Functional languages make this programming style more natural.

# Imperative Programming

- ▶ + Easier to learn, taught more often
- ▶ + Better development environments (IDE) and libraries
- ▶ + Typically faster
- ▶ - Side effect, hard to reason
- ▶ - Hard to parallel?

# Functional Programming

- ▶ + side-effect Free and easy to reason: Input and Output completely describes the behavior of any function
- ▶ + less code
- ▶ - less efficient?
- ▶ - less support for IDE and libraries
- ▶ - hard to learn, not taught in school often

Why teach/learn FL? <sup>6</sup>

---

<sup>6</sup><http://www.pl-enthusiast.net/2018/07/24/teaching-programming-languages/>

# Logic Programming

- ▶ Data as facts and relations
- ▶ Computations as logical inferences
- ▶ Control constructs: if-then-else and recursion

# Reverse a list

## Detailed Main Idea <sup>7</sup>

### Imperative Programming

```
void reverse(struct node** head_ref)
{
    struct node* prev = NULL;
    struct node* current = *head_ref;
    struct node* next;
    while (current != NULL)
    {
        next = current->next;
        current->next = prev;
        prev = current;
        current = next;
    }
    *head_ref = prev;
}
```

### Functional Programming

```
(define (rev lst)
  (if (null? lst)
      lst
      (append (rev (cdr lst))
               (list (car lst))
               )
  )
)
```

### Logic Programming

```
rev([], []).
rev([H|T, L] :-
    rev(T, T1),
    append(T1, [H], L).
```

---

# Reverse a list – Functional Programming

while ( ) {

}

② // change next of current  
// actual reverse happens  
curr → next = prev

③ // Move prev & current one step forward  
prev = curr  
curr = next

prev    current    next  
                    →

# Reverse a list – Functional Programming

Simple Notes on Racket Syntax:

- First element in the list: `(car lst)`
- Tail of the list: `(cdr lst)`
- if-then-else: `(if condition then-stmt else-stmt)`  
`(if (equal? 'a x)`  
    `1`  
    `0)`

# Reverse a list – Logic Programming

HIT

Rev ↓

$(T_1)$  H  $\rightarrow$  L

~~Rev({1,2,3}, (L))~~

L = {3,2,1}

# Ray Tracer

# Review

1. What is Programming Language?
2. Programming Language has two components:
  - ▶ Syntax
  - ▶ Semantics
3. Parts of a Program:
  - ▶ Computation
  - ▶ Composition
  - ▶ Abstraction
4. Programming Paradigms and Programming Styles
